

MPD Solution: Delivering Successful Results

Managed Pressure Drilling has a growing acceptance in the drilling industry as a means by which to mitigate certain drilling related problems such as narrow drilling windows or wellbore stability issues, among others. Benefits of MPD include enhanced primary well control, mitigating ballooning events, increased ROP, reducing drilling mud costs, mitigating differential sticking events, and better cementing operations in loss zones.

When faced with these drilling related issues, successful results require a service oriented MPD well engineering approach along with dependable equipment and good field personnel.

Challenge/Problem

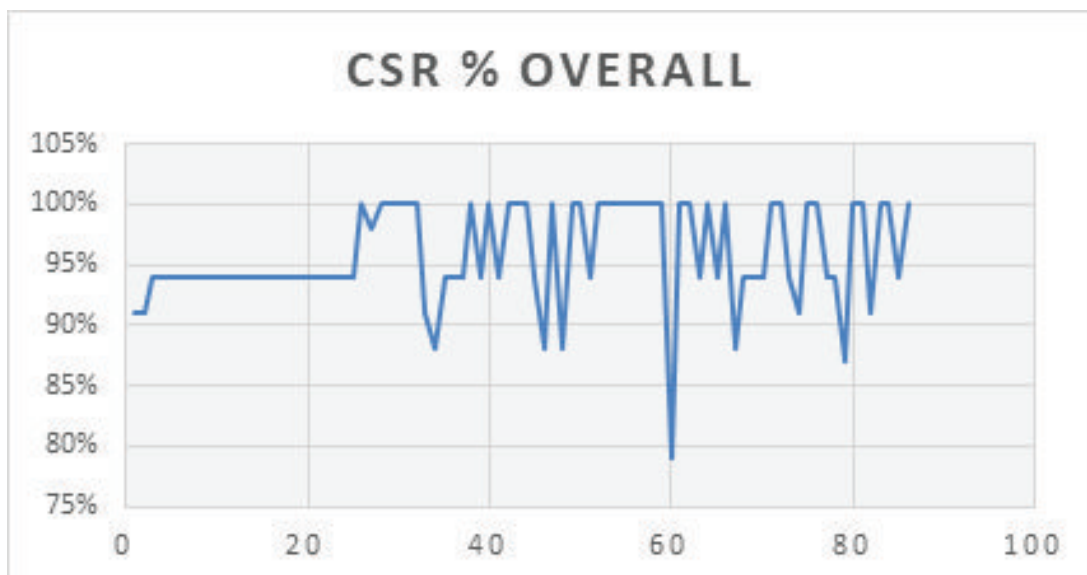

The challenge, especially in North American land drilling business units, is for operators to have engineers or subject matter experts who know and understand how to best utilize MPD to manage drilling related problems.

Action/Solution

Pruitt MPD Services' business model is to provide a strong client-focused well engineering team, highly competent and trained MPD personnel, industry leading equipment, cradle to grave asset management, and a robust maintenance inspection plan.

Execution/Results

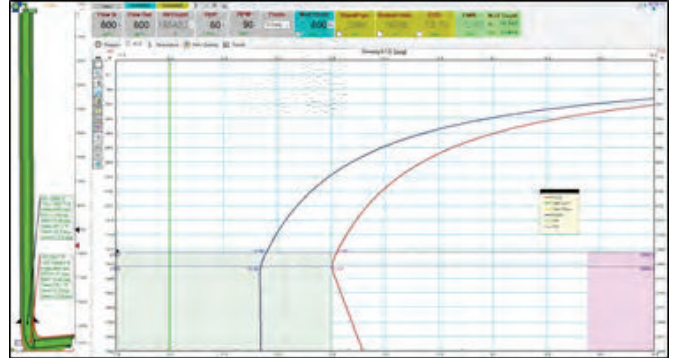

In the past two years, Pruitt MPD Services has executed MPD operations on nearly one hundred wells in the USA and Canada with a 96% average Client Satisfaction Rating.

MPD Solution: Delivering Successful Results

How do we attain high client satisfaction rating job after job? We plan and work with PRIDE!

OPTIMAL Pressure Control aims to deliver client satisfaction for the services that we provide. Client feedback and comments will help us to deliver the service that you require.
